

Definition: A sequence (a_n) of real numbers is *eventually constant* if there is $c \in \mathbb{R}$ and $N \in \mathbb{N}$ such that $a_n = c$ for all $n \geq N$.

(1) Let (a_n) be a sequence in \mathbb{R} , and consider the bi-implication: " $\lim a_n = \infty \iff \lim \frac{1}{a_n} = 0$."

For each direction of this implication, either prove that direction if it is true, or else give a counterexample if it is false.

Forward direction:

Proof Suppose $\lim a_n = \infty$

Let $\varepsilon > 0$

Consider $M = \frac{1}{\varepsilon}$, then for some $N > M$,

$a_n > M$ whenever $n \geq N$

So $a_n > \frac{1}{\varepsilon} \Rightarrow \underline{|\frac{1}{a_n}| < \varepsilon}$ whenever $n \geq N$

So $\lim \frac{1}{a_n} = 0$

Backward direction:

Counterexample Consider $a_n = -n$

So $\lim \frac{1}{a_n} = \lim \frac{1}{-n} = 0$

But $\lim a_n = -\infty$

□

(2) Let (a_n) and (b_n) be sequences of real numbers. Prove that if $\lim a_n = 0$ and (b_n) is bounded, then $\lim a_n b_n = 0$.

Proof. Since (b_n) is bounded, $(|b_n|)$ is also bounded

Consider the constant sequence $S_n = \sup(|b_n|)$

Then $\lim(S_n) = \sup |b_n|$

Since $\lim(a_n) = 0 \Rightarrow \lim(|a_n|) = 0$

So $\lim |a_n S_n| = \lim |a_n| \cdot \lim |S_n| = 0$

Since $S_n = \sup |b_n|$, $0 \leq |b_n| \leq |S_n|$ for all $n \in \mathbb{N}$

$\Rightarrow 0 \leq |a_n b_n| \leq |a_n S_n|$ for all $n \in \mathbb{N}$

Since $\lim 0 = \lim |a_n S_n| = 0$,

by the squeeze thm, $\lim |a_n b_n| = 0$

Therefore $\lim a_n b_n = \lim |a_n b_n| = 0$

□

(3) Determine the limits (in $\mathbb{R} \cup \{\pm\infty\}$) of the following sequences, and prove your results:

(a) $\lim_{n \rightarrow \infty} \frac{2^n}{n!}$ (b) $\lim_{n \rightarrow \infty} \frac{n^n}{n!}$ (c) $\lim_{n \rightarrow \infty} b_n$, where $b_1 = 2$ and $b_{n+1} = \frac{b_n^2 + 2}{2b_n}$

(a) $\lim_{n \rightarrow \infty} \frac{2^n}{n!} = 0$

Proof Consider $a_n = \frac{2^n}{n!}$

Take $n \in \mathbb{N}$

$$\lim_{n \rightarrow \infty} \left(\frac{a_{n+1}}{a_n} \right) = \lim_{n \rightarrow \infty} \frac{2^{n+1} n!}{(n+1)! 2^n} \\ = \lim_{n \rightarrow \infty} \frac{2}{n+1} = 0 < 1$$

So $\lim_{n \rightarrow \infty} \frac{2^n}{n!} = 0$

□

(b) $\lim_{n \rightarrow \infty} \frac{n^n}{n!} = +\infty$

Proof $\frac{n^n}{n!} = \frac{n}{n-1} \cdot \frac{n}{n-2} \cdots \frac{n}{1}$

Let $M > 0$

Consider $N = \lceil M \rceil$

Let $n \geq N$, then $\frac{n^n}{n!} > n \geq N > M$

So $\lim_{n \rightarrow \infty} \frac{n^n}{n!} = +\infty$

□

So for any $n \in \mathbb{N}$
 $a_{n+1} \leq a_n$.

(c) Assume $\lim b_n = l$

then $\lim b_{n+1} = \lim \frac{b_n^2 + 2}{2b_n}$
 $= \lim \frac{b_n}{2} + \lim \frac{1}{b_n}$

$\Rightarrow l = \frac{1}{2}l + \frac{1}{l}$

$\frac{1}{2}l = \frac{1}{l} \Rightarrow \boxed{l = \sqrt{2}}$

Since $b_n > 0$ for all $n \in \mathbb{N}$

Therefore $\lim_{n \rightarrow \infty} b_n$ can only be $\sqrt{2}$ if it exists.

Now we prove that (b_n) does converge

Let $n \in \mathbb{N}$, $b_{n+1} = \frac{b_n}{2} + \frac{1}{b_n}$
 $\geq 2 \sqrt{\frac{b_n}{2} \cdot \frac{1}{b_n}} = \sqrt{2}$

Since $b_1 = 2 \Rightarrow \forall n \in \mathbb{N}, b_n \geq \sqrt{2}$

So $\frac{b_{n+1}}{b_n} = \lim_{n \rightarrow \infty} \left(\frac{1}{2} + \frac{1}{b_n^2} \right) \leq 1$

Therefore (b_n) is decreasing and bounded below \Rightarrow (b_n) converges
Therefore $\lim(b_n) = \sqrt{2}$

□

- (4) Suppose A is a discrete² subset of \mathbb{R} , and let (a_n) be a convergent sequence of numbers in A . Prove that either (a_n) is eventually constant or $\lim a_n \notin A$.

hw 3 Q1 discrete $A \subseteq \mathbb{R}$ 中的任意 seq, 要么 eventually const
要么 $\lim(a_n)$ 在 A 之外

Proof. We prove it by contradiction

Write $\lim a_n = L$

Assume (a_n) is not eventually constant
and $\lim a_n \in A$

Since A is discrete, there exists some $\varepsilon > 0$
such that $(L - \varepsilon, L + \varepsilon) \cap A \setminus \{L\} = \emptyset$

Since $\lim a_n = L$, there exists some $N \in \mathbb{N}$ s.t.
for all $n \geq N$, $|a_n - L| < \varepsilon$, and since
 (a_n) is not eventually constant, there
exists $n \geq N$ s.t. $a_n \neq L$ and $|a_n - L| < \varepsilon$
i.e. $a_n \in (L - \varepsilon, L + \varepsilon)$

So $a_n \in (L - \varepsilon, L + \varepsilon) \cap A \setminus \{L\}$,

contradicting with $(L - \varepsilon, L + \varepsilon) \cap A \setminus \{L\} = \emptyset$

This finishes the proof that (a_n) is either
eventually constant or $\lim(a_n) \in A$

□

(5) For each positive integer M , let \mathbb{Q}_M be the set of all rational numbers m/n where $m, n \in \mathbb{Z}$ and $|m| \leq M$. Prove that for all $M \in \mathbb{N}$, every sequence of distinct numbers in \mathbb{Q}_M converges.

Proof Let (a_n) be an arbitrary sequence in \mathbb{Q}_M
Let $\varepsilon > 0$

Since for each $q \in \mathbb{Z}$, there are only finitely many terms of (a_n) that has q as denominator

Consider $N = \max \left\{ k : a_k = \frac{p}{q} \text{ for some } p \leq M \text{ and } q \leq \left\lceil \frac{M}{\varepsilon} \right\rceil \right\}$

Take arbitrary $n \geq N+1$

then $a_n = \frac{M}{q}$ where $q > \frac{M}{\varepsilon}$

$$\text{So } a_n \leq \frac{M}{\frac{M}{\varepsilon}} = \varepsilon$$

So $\lim_{n \rightarrow \infty} (a_n) = 0$

This finishes the proof that every sequence of distinct numbers in \mathbb{Q}_M converges

□

- (6) Let (a_n) and (b_n) be sequences of real numbers such that $a_n < b_n$ for all n .
- (a) Show that if $\lim a_n = \infty$, then $\lim b_n = \infty$.
- (b) Given an example to show that (a_n) and (b_n) could converge to the same real number.

(a) Suppose $\lim a_n = \infty$

Let $M > 0$ and fix it

Then for some $N \in \mathbb{N}$, $a_n > M$ whenever $n \geq N$

Since $a_n < b_n$ for all $n \Rightarrow$

$b_n > a_n > M$ for all $n \geq N$

Therefore $\lim_{n \rightarrow \infty} (b_n) = \infty$

□

(b) Consider $a_n = \frac{1}{n}$, $b_n = \frac{2}{n}$ for all $n \in \mathbb{N}$

So $a_n < b_n$ for all $n \in \mathbb{N}$

But $\lim a_n = \lim b_n = 0$

- (7) Let (a_n) be a sequence of positive real numbers. Show that if $\lim \frac{a_{n+1}}{a_n} = L > 1$, then $\lim a_n = \infty$.

hw 3 ② if positive seq (a_n) & $\lim \frac{a_{n+1}}{a_n} = L > 1$, then
 $\Rightarrow \lim(a_n) = \infty$

Proof Let $\varepsilon = \frac{L-1}{2}$

Since $\lim \frac{a_{n+1}}{a_n} = L$, there is some $N_1 \in \mathbb{N}$

s.t. $|\frac{a_{n+1}}{a_n} - L| < \varepsilon$ for all $n \geq N_1$

i.e. $L - \varepsilon < \frac{a_{n+1}}{a_n} < L + \varepsilon$

$\Rightarrow \frac{a_{n+1}}{a_n} > (\frac{L}{2} + \frac{1}{2})$ for all $n \geq N_1$

Let $M > 0$.

Then there exists some $N_2 \geq N_1$

s.t. $(\frac{L}{2} + \frac{1}{2})^{N_2} a_{N_2} > M$, since $\frac{L}{2} + \frac{1}{2} > 1$

then $\forall n \geq N_2, a_n \geq (\frac{L}{2} + \frac{1}{2})^{n-N_2} a_{N_2} > M$

Therefore $\lim a_n = \infty$

□

- 8) Find the lim sup and lim inf of the following sequences. (No justification is needed).

(a) $(a_n)_{n \geq 1}$, where $a_n = (-1)^{n+1} + \frac{(-1)^n}{n}$ $\limsup(a_n) = 1$, $\liminf(a_n) = -1$

(b) $(b_n)_{n \geq 1}$, where $b_n = \sin \frac{1}{n}$ $\limsup(b_n) = \liminf(b_n) = 0$

(c) (c_n) , where $c: \mathbb{N} \rightarrow \mathbb{Q}$ is any bijection $\limsup(c_n) = +\infty$, $\liminf(c_n) = -\infty$

(d) (d_n) , where $d_n = \ln n + \cos n$

$\limsup(d_n) = \liminf(d_n) = +\infty$

(9) Let $a, b \in \mathbb{R}$ with $a < b$. Find the limit of the sequence (s_n) defined recursively by $s_1 = a$, $s_2 = b$, and for all $n \in \mathbb{N}$,

$$s_{n+2} = \frac{s_n + s_{n+1}}{2}.$$

Prove your claim.

$$\lim_{n \rightarrow \infty} s_n = \frac{2}{3}b + \frac{1}{3}a$$

Proof

Let $d_n = s_{n+1} - s_n$ for all $n \in \mathbb{N}$

$$\text{Then } d_1 = s_2 - s_1 = b - a$$

$$\begin{aligned} d_n &= \frac{s_{n-1} + s_n}{2} - s_n, \text{ if } n \geq 2 \\ &= -\left(\frac{1}{2}s_n - \frac{1}{2}s_{n-1}\right) = -\frac{1}{2}d_{n-1} \end{aligned}$$

$$\text{Note that for all } n \in \mathbb{N}, \underline{s_{n+1} = \left(\sum_{i=1}^n s_{i+1} - s_i\right) + s_1}$$

$$= \underline{s_1 + \sum_{i=1}^n d_i} = a + \frac{1 - (-\frac{1}{2})^n}{1 - (-\frac{1}{2})} d_1 = a + \frac{2}{3}(1 - (-\frac{1}{2})^n)(b-a)$$

$$\text{So } \lim_{n \rightarrow \infty} s_n = \lim_{n \rightarrow \infty} s_{n+1} = \lim_{n \rightarrow \infty} \left(a + \frac{2}{3}(b-a) - \frac{2}{3}(-\frac{1}{2})^n(b-a)\right)$$

$$= \underline{\frac{2}{3}b + \frac{1}{3}a} - \frac{2}{3}(b-a) \lim_{n \rightarrow \infty} (-\frac{1}{2})^n \text{ by limit law}$$

$$\text{Since } |-\frac{1}{2}| < 1, \lim_{n \rightarrow \infty} (-\frac{1}{2})^n = 0$$

$$\text{So } \underline{\lim_{n \rightarrow \infty} s_n = \frac{2}{3}b + \frac{1}{3}a}$$

□

(10) Give an example of a divergent sequence (a_n) in \mathbb{R} with a convergent subsequence such that all convergent subsequences of (a_n) converge to the same limit.

Consider: $a_n = n^{(-1)^n}$ i.e. $(a_n) = (1, 2, \frac{1}{3}, 4, \frac{1}{5}, 6, \dots)$

Then (a_n) diverges but every convergent subsequence of (a_n) converges to $L=0$

Proof

① Consider $(a_{n_k} : k \text{ is odd}) = (1, \frac{1}{3}, \frac{1}{5}, \dots) \rightarrow 0$

② Every convergent subsequence of (a_n) converges to 0

Let (a_{n_k}) a convergent subsequence of (a_n)

Then $k \mapsto n_k$ is a strictly increasing function

c) Suppose there are infinitely $k \in \mathbb{N}$ s.t. n_k is even

Now we show that (a_{n_k}) diverges, so this is impossible

Let $L \in \mathbb{R}$. Take $M=1$. Let $N \in \mathbb{N}$ and fix it.

If there is no $n_k > N$ s.t. $a_{n_k} > L+1$

then there are only finitely many even n_k ,

contradicts, which indicates there must exist

$n_k > N$ s.t. $|a_{n_k} - L| > M$

$\Rightarrow (a_{n_k})$ diverges, contradicts

Therefore there can only be finitely many $k \in \mathbb{N}$ s.t. n_k is even

So we can cut the tail and then all remaining n_k ($k \in \mathbb{N}$ are odd) \Rightarrow (a_{n_k}) converges to 0.

(11) Let (a_n) and (b_n) be bounded sequences of positive real numbers.

(a) Show that $\limsup(a_n + b_n) \leq \limsup(a_n) + \limsup(b_n)$.

(b) Give an example to show that $\limsup(a_n + b_n)$ might not equal $\limsup(a_n) + \limsup(b_n)$.

(c) Show that if (a_n) converges, then $\limsup(a_n + b_n) = \limsup(a_n) + \limsup(b_n)$.

(a) Proof. $\limsup(a_n + b_n) = \lim_{n \rightarrow \infty} \sup\{a_k + b_k \mid k \geq n\}$

Let $n \in \mathbb{N}$. Let $l_n = \sup\{a_k + b_k \mid k \geq n\}$

$$l_{n_1} = \sup\{a_k \mid k \geq n_1\}$$

$$l_{n_2} = \sup\{b_k \mid k \geq n_2\}$$

Let $\varepsilon > 0$

then $(\forall k \geq n)$, $a_k < l_{n_1} + \frac{\varepsilon}{2}$ and $b_k < l_{n_2} + \frac{\varepsilon}{2}$

$$\Rightarrow \underline{a_k + b_k < l_{n_1} + l_{n_2} + \varepsilon}$$

(whenever $\varepsilon > 0$)

So $l_n \leq l_{n_1} + l_{n_2}$

Since n is arbitrary, $l_n \leq l_{n_1} + l_{n_2}$ for all $n \in \mathbb{N}$

Therefore $\lim l_n \leq \lim l_{n_1} + \lim l_{n_2}$

(b) counterexample i.e. $\limsup(a_n + b_n) \leq \limsup(a_n) + \limsup(b_n)$

$$a_n = 1 + (-1)^n \Rightarrow \limsup(a_n) = 2$$

$$b_n = 1 + (-1)^{n+1} \Rightarrow \limsup(b_n) = 2$$

$$\text{but } \limsup(a_n + b_n) = \underline{1+1=2} < \limsup(a_n) + \limsup(b_n)$$

(c) write $\underline{\lim a_n = l}$. $\limsup(a_n) = \lim a_n = l$ since a_n converges.

$$\text{Then } \limsup(a_n) + \limsup(b_n) = l + \limsup(b_n) = l + \lim l_{n_2}$$

$$= \lim(l + l_{n_2}) = \lim(l_{n_1} + l_{n_2}) = \limsup(a_1 + a_2)$$

(12) Prove that there exists a sequence (a_n) in \mathbb{R} such that for every $r \in \mathbb{R}$ there is a subsequence of (a_n) that converges to r .

hw 3 ③ \mathbb{R} 中存在一个 seq 使得 $\{\text{all subseq, lim of } (a_n)\} = \mathbb{R}$

Proof Since $\mathbb{N} \approx \mathbb{Q}$, there exists a surjective function $S: \mathbb{N} \rightarrow \mathbb{Q}$.

Note that (S_n) is a sequence.

Let $r \in \mathbb{R}$ be arbitrary real number

Then there exists a sequence in \mathbb{Q} (q_n)

s.t. $(q_n) \rightarrow r$

Since $S: \mathbb{N} \rightarrow \mathbb{Q}$ is surjective,

consider the subsequence (S_{n_k}) of (S_n)

defined by $S_{n_k} = q_m$ for some $m \in \mathbb{N}$, for all $k \in \mathbb{N}$

Then Take a monotonic subsequence of (S_{n_k}) as (S_m)

(S_m) is a subsequence of (S_{n_k}) , so it is also a subsequence of (S_n)

Let $\varepsilon > 0$.

Then there is some $N \in \mathbb{N}$ s.t. $|q_n - r| < \varepsilon$
whenever $n \geq N$

Since there is some term S_m s.t. $S_m = q_N$

and since (S_m) is monotonic, $|S_m - r| < \varepsilon$

Therefore $(S_m) \rightarrow r$ whenever $m \geq M$

(13) Determine whether the following sets are open, closed, both, or neither (no justification needed):

- (a) $\{\frac{1}{n} : n \in \mathbb{N}\}$ *neither*
(b) $\{\frac{1}{n} : n \in \mathbb{N}\} \cup \{0\}$ *closed & not open*
(c) $\bigcup_{n \geq 1} [\frac{1}{n}, 3 - \frac{1}{n}]$ *open & not closed*
(d) \mathbb{Z} *closed & not open*
(e) \mathbb{Q} *neither*
(f) $\bigcap_{n \geq 1} (-\frac{1}{n}, \frac{1}{n})$ *closed & not open*

(14) Either prove the following if it is true, or else give a counterexample if it is false: if $A \subseteq \mathbb{R}$ is closed and discrete, then there is $\epsilon > 0$ such that $|a - b| \geq \epsilon$ for every pair of distinct elements $a, b \in A$. [cf: HW 1, #11(b)]

Counterexample

Consider $S_n = \sum_{k=1}^n \frac{1}{k}$, which is a partial sum of harmonic series.

$$A = \{S_n : n \in \mathbb{N}\}$$

There is no subsequential limit in S_n , so

A has no limit point $\Rightarrow A' \subseteq A \Rightarrow \underline{A \text{ is closed}}$

And for each S_n ($n \in \mathbb{N}$), consider

$$\frac{1}{\epsilon} n \leq \frac{1}{\epsilon} \quad \underline{\epsilon = \frac{1}{n+1}}, \text{ then } \forall \epsilon (S_n) \cap A \setminus \{S_n\} = \emptyset$$

so A is discrete

But there is no $\epsilon > 0$ s.t. $|a - b| \geq \epsilon$

for each pair of $a, b \in A$, since if we take $\epsilon > 0$

$$S_{\frac{1}{\epsilon} + 1} - S_{\frac{1}{\epsilon}} < \frac{1}{\frac{1}{\epsilon}} = \epsilon$$

(15) Suppose the set $A \subseteq \mathbb{R}$ is infinite, bounded, and discrete. Prove that there is a convergent sequence in A whose limit is not in A .

hw 3 ④ bounded + infinite + discrete $A \subseteq \mathbb{R}$ 一定有不在 A 中的 subseq. lim

Proof Take an arbitrary seq. (a_n) in A s.t.

$$\forall m, n \in \mathbb{N}, a_m \neq a_n$$

By the BW theorem, there exists a subsequence of (a_n) that converges. Denote that subsequence by (a_{n_k}) and write $\lim a_{n_k} = L$

Claim: $L \notin A$

Suppose $L \in A$.

Since L is the limit of a sequence in A ,

L is a limit point of A

$$\Rightarrow \forall \varepsilon > 0, \exists x \in A (x \neq L) \text{ s.t. } 0 < |x - L| < \varepsilon$$

$$\Rightarrow \underline{x \in V_\varepsilon(L)} \Rightarrow \underline{x \in V_\varepsilon(L) \cap A} \text{ ①}$$

Since A is discrete and $L \in A$, there exists some $\varepsilon > 0$ s.t. $V_\varepsilon(L) \cap A = \{L\}$ ②

① ② contradicts

So $L \notin A$

□
